Pickens Co.

DAHLIAS

CULTURE—Do not plant till ground is warm. Plant tuber in horizontal position, from four to six inches deep, three feet apart. Do not put manure or fertilizer, in direct contact with the tuber. Commercial fertilizer, mixed with the soil, and a mulch, after planting, and later worked in the soil, of manure, and unleached wood ashes, is good. A small tuber gives as good results as a large one, as some varieties do not make large tubers. When plants are 12 to 15 inches high, it is advisable to pinch out the top: this will force laterals near the ground, and produce stocky plants. To produce largest flowers, and long stems, disbud as you would chrysanthemums. After plants are too large to work, mulch heavily with dead grass or straw, to conserve moisture. A mulch one foot deep is not too much. The varieties listed, are all standard varieties, a number of them of the more recent introductions. Should I be sold out of variety ordered, if you will specify that I may substitute can probably send some other just as good.

The abbreviations after names, refer to the different types of Decorative, Informal Decorative, Cactus, Hybrid-cactus, Show, Peony-flowered, Ball-type and Pompoms.

	Each
Amun Ra (Dec.) a very large flower of coppery orange and gold tints. Good keeper, and very popular	\$.50
Alice Whittier (Hy. cac.) clear yellow, extra large on long stems	1.00
